

PhysEd Pro — Data Privacy & Security Overview

Prepared for district IT review · Version 3.1 · June 2026

What it is

PhysEd Pro is a single-file, offline web application a PE teacher uses to record class-period attendance, dress-out, and participation points, and to generate a CSV for the Canvas gradebook. It replaces a manual grading spreadsheet. It is a local utility in the same category as a spreadsheet file — **not** an online service.

Architecture — no server, no transmission

- The app is six static files opened in a browser (or installed as a PWA). It functions fully offline.
- It makes **zero network requests** at runtime: no backend server, no accounts or logins, no analytics or telemetry, no cookies, no third-party scripts, fonts, or CDNs.
- All data is stored locally in the browser (IndexedDB) on the teacher's device. Nothing is ever transmitted to the developer or to any third party. The developer has no access of any kind to entered data.
- Students never use, log into, or interact with the application.

Data elements stored (entered by the teacher)

Student name; student ID / SIS ID (for Canvas matching); class period; daily attendance codes (e.g., Absent, Tardy, Excused, Non-suit, Non-participation); weekly point totals; brief teacher comments. No date of birth, contact information, demographic data, health records, or student-created content.

Data flow

1. Entry	Teacher records codes on their own device; data persists in browser storage on that device only.
2. Backup	Teacher saves a backup file to a location they choose — recommended: a district-managed Google Drive / OneDrive synced folder, so the record copy resides in district storage under existing district security, access control, and retention.
3. Grades	A CSV is generated locally and uploaded by the teacher through Canvas's standard gradebook import. The app has no API connection to Canvas, Google, Microsoft, or any SIS.

What it does NOT do

No data transmission of any kind · no OAuth/API access to district Google, Microsoft, Canvas, or SIS systems · no student accounts · no advertising · no AI processing · no sale, sharing, or developer collection of any data.

FERPA posture

Attendance and grade data are education records under FERPA. With PhysEd Pro, those records never leave the teacher's and district's control: the tool functions like spreadsheet software, and the developer is not a recipient of any student data — so there is typically no third-party data disclosure to evaluate and no vendor data processing agreement applicable (the developer processes nothing). Records remain governed by existing district policy wherever the teacher stores them, which is why district-managed storage is the documented, recommended backup location. Reference: U.S. Dept. of Education, studentprivacy.ed.gov. This sheet is informational, not legal advice; district policy governs.

Security notes

Data at rest is protected by the device's OS login and disk encryption per district device policy; browser same-origin isolation applies to local storage. Clearing the browser's site data removes all locally stored records. The app is distributable as files for inspection — total codebase is small and human-auditable, and the absence of network calls is verifiable in the browser's developer tools (Network tab shows no runtime requests).
